Akshay Sawant

AWS DevOps Engineer

AWS Solutions Architect Associate

Contact

Phone: **9096505065**

E-Mail: **akshaysawant9009@gmail.com**

Address: **Hinjawadi, pune**

Technical Skills

- Operating Systems: Linux (Ubuntu)
- Version Control: Git, GitHub
- CI/CD Tools: Jenkins, GitHub Actions
- Configuration Management: Ansible
- Containerization & Orchestration: Docker, Kubernetes
- Infrastructure as Code (IaC): Terraform
- Monitoring & Visualization: Grafana, Prometheus (if used)
- Cloud Platforms: AWS (EC2, S3, IAM, VPC, RDS, EKS)
- DataBase: Mysql
- Programming: Python

Education

Shivaji University

Bachelor of Mechanical Engineering

Kirloskar Junior College

Kirloskar High School,

Language

- **English**
- **Hindi**
- **Marathi**

Career Objective

"AWS Certified DevOps Engineer with 4.5 years of hands-on experience in cloud infrastructure, automation, and monitoring. Adept at reducing deployment time, improving application reliability, and enhancing cost efficiency in AWS environments. Looking to contribute to a dynamic team where innovation, scalability, and security are priorities."

Roles and Responsibilities

- Designed and managed AWS cloud infrastructure including EC2, EBS, S3, VPC, RDS, ELB, Auto Scaling, CloudFront, Route53, and CloudWatch to ensure high availability, scalability, and cost efficiency.
- Configured EC2 instances, security groups, Elastic Load Balancers, and AMIs; implemented Auto Scaling for fault-tolerant and cost-optimized systems.
- Defined and implemented the company's DevOps and cloud strategy across hybrid environments .
- Automated build and deployment processes using Git, Maven, Jenkins, Ansible, and Docker for faster release cycles.
- Created and managed Docker images and containers; configured inter-container communication for application services.
- Built and maintained Jenkins pipelines for continuous integration (CI) and end-to-end deployment automation (CD).
- Developed and executed Ansible Playbooks for provisioning, configuration management, and multi-node deployments.
- Strong understanding of networking concepts including DNS, Load Balancing, and TCP/IP.
- Collaborated with development and operations teams to troubleshoot issues, improve workflows, and deliver reliable applications.
- Familiar with SDLC methodologies such as Agile and Waterfall; adaptable to dynamic project requirements.
- Proven ability to assess issues, identify root causes, and apply corrective actions to maintain smooth operations.

Experience

Company: Swiftsoft Infotech services pvt Ltd 2021 – 2025

Project Managed- CI/CD Automation |

- **End-to-End CI/CD Pipeline**: Built and automated a complete CI/CD workflow using Jenkins Declarative Pipeline to handle code checkout, build, testing, artifact storage, and deployment.
- **Build & Test Automation**: Integrated Maven with JDK in Jenkins to compile, test, and package Java code into JAR files on every GitHub .
- **Artifact Management:** Configured Sonatype Nexus (Dockerized) to store and version artifacts, enabling easy traceability, reuse, and rollback.

- **Automated Deployment:** Deployed packaged artifacts to an Nginx web server, making the application available instantly over HTTP.
- **Infrastructure Setup & Security**: Installed and managed Jenkins, Nexus, and Nginx on Linux servers, with secure credential management and proper permissions for safe automation.

- **Tools & Technologies:** : Jenkins, Maven, JDK, Nexus, Docker, Nginx, Git, Linux.

Project: Automated Cloud Infrastructure with Terraform & Jenkins

Infrastructure as Code (IaC) & CI/CD Automation

- **Developed Terraform code** : Automate provisioning of AWS resources including VPC, EC2 instances, and S3 buckets, following Infrastructure as Code principles.
- Worked in a feature branch for isolated code development and pushed changes to GitHub for version control and peer collaboration.
- **Configured a Jenkins CI/CD pipeline**: Automatically pull Terraform code from GitHub and execute infrastructure deployment steps:Terraform init ,Terraform validate, Terraform plan ,Terraform apply Automatically.
- **Implemented remote backend configuration:** Amazon S3 (for state file storage) and DynamoDB (for state locking) to ensure safe, consistent, and concurrent-free deployments.
- **Used IAM roles:** Attached to Jenkins EC2 instance for secure AWS authentication, avoiding hardcoded credentials.
- Verified resource creation and configuration in the AWS Management Console after each successful Jenkins pipeline run.
- **Validated and tested** :Check the infrastructure changes through Jenkins, then raised a pull request (PR) to merge the verified code into the main branch in GitHub for production readiness.
- Delivered a fully automated, version-controlled, and secure CI/CD pipeline for AWS infrastructure, reducing manual effort and improving deployment consistency, traceability, and security.

Tools & Technologies: Terraform, Jenkins, AWS (VPC, EC2, S3, IAM, DynamoDB), GitHub, S3 Backend, Linux, Shell Script

---

DevOps CI/CD Project: Advanced cloud infrastructure Automation | Kubernetes project

Project Overview

Designed and implemented a fully automated CI/CD pipeline for a 3-tier Java web application hosted on AWS. The goal was to eliminate manual intervention across the build, test, and deployment cycle while integrating security and quality checks at every stage. The pipeline ensured every code change goes through an automated processe from source control to production making it faster, more reliable, and secure releases.

Key Responsibilities & Achievements

CI/CD Automation:

- Built an end-to-end Jenkins pipeline that automated the entire process — from code checkout in GitHub, build and test with Maven, static code analysis in SonarQube, security scanning with OWASP Dependency Check, artifact storage in Nexus, image creation with Docker, and deployment to Kubernetes (EKS).

Infrastructure as Code (IaC):

- Used Terraform to provision and manage AWS resources including the Jenkins server, SonarQube server, Nexus Repository server, EC2 instances, VPC, subnets, IAM roles, and EKS clusters — ensuring automatic infrastructure setup.

Code Quality & Security:

- Integrated SonarQube with Jenkins to continuously monitor code quality.
- Added OWASP Dependency Check to automatically detect vulnerable dependencies during the build time.

Artifact & Version Management:

- Configured Nexus Repository Manager as a centralized storage for versioned .jar artifacts.
- Simplified rollbacks, traceability, and dependency management for all builds.

Containerization & Image Management:

- Containerized the application using Docker.
- Tagged and pushed images to DockerHub.
- Ensured consistency across Dev, QA, and Production environments.

Automated Deployment on Kubernetes (EKS):

- Orchestrated deployments to EKS using Jenkins and Kubernetes manifest charts.
- Implemented rolling updates and auto-healing configurations to maintain zero-downtime releases.

Secure Integrations & DevSecOps Practices:

- Configured secure Jenkins credentials for SonarQube tokens, Nexus access, DockerHub authentication, and NVD API keys.
- Ensured security across all stages of the pipeline by following DevSecOps best practices.

Secure Integrations & DevSecOps Practices:

- Enabled real-time feedback loops through Jenkins webhooks and notifications.
- Significantly reduced build and deployment turnaround times.

Tools: Jenkins | GitHub | Maven | SonarQube | Nexus | Docker | Kubernetes (EKS) | Terraform | OWASP Dependency Check | AWS EC2 | VPC | IAM | DockerHub | Git | Java | YAML | Groovy
